Increased risk

The symbol above gives an indication of the level of risk you carry of developing ischaemic heart disease during your life. This has been calculated on the basis of the family history you have provided.

that will reduce your risk of developing angina or having a heart attack.

1010

Your family history suggests that you may be at increased risk of inherited or familial hypercholesterolemia (FH). This may also mean that you carry a risk of ischaemic heart disease and "heart attack" also known as myocardial infarct (MI).

1014

Current guidelines suggest that you should discuss your family history further with your doctor and ask to have your cholesterol checked.

1016

It would be worth discussing other factors that may also increase your risk of heart attacks or angina.

1020

If you do have FH there is effective treatment available for developing angina or having a heart attack.

1018

You may want to book a rapid access appointment with our online counselor. The online counselor, with your permission, will receive a copy of this report and your family history. They will be able to offer further guidance.

1112

Your family history suggests that you may have inherited a gene that causes you to have a high level of cholesterol in your blood.

If you have inherited familial hypercholesterolemia (FH) then you are at greater risk of heart attacks or. angina . The diagnosis of FH can only be confirmed by having some blood tests .
